

The current mechanism of testing in case of infection at stage1 and stage 2 transmission needs change in case of community spread of the disease. We need to go for pooled or mass testing of samples to identify hotspots of spread of infection. Testing can be done by utilizing innovations of molecular testing methods developed by biotech companies. By giving incentives and quick regulatory clearances we can create capacity of mass testing. This will help us in identifying hotspots and taking stringent quarantine measures in these areas while reducing the lockdown in other areas.
